# Climate Risk Profile

Burkina Faso | Drought & Agriculture Focus

40-year trends | October 2026 | Country Climate Profile Generator

MOCKUP - LAYOUT PREVIEW - ALL DATA ILLUSTRATIVE

## Key Findings

| +1.2 °C | -8% | 27 / 185 |
|---|---|---|
| warming since 1985 | Sahel-zone rainfall vs baseline | ND-GAIN vulnerability rank |

Every figure in this brief is footnoted with its source and URL. In a real run all numbers are fetched live from the cited open databases.

## 1. Observed trends

Mean annual temperature has risen steadily over the observation period, with the most recent decade the warmest on record (Figure 1). Rainfall shows growing year-to-year variability: the Sudanian zone receives a comparable annual total but concentrated in fewer, more intense events, extending the dry season at both ends (Figure 2).

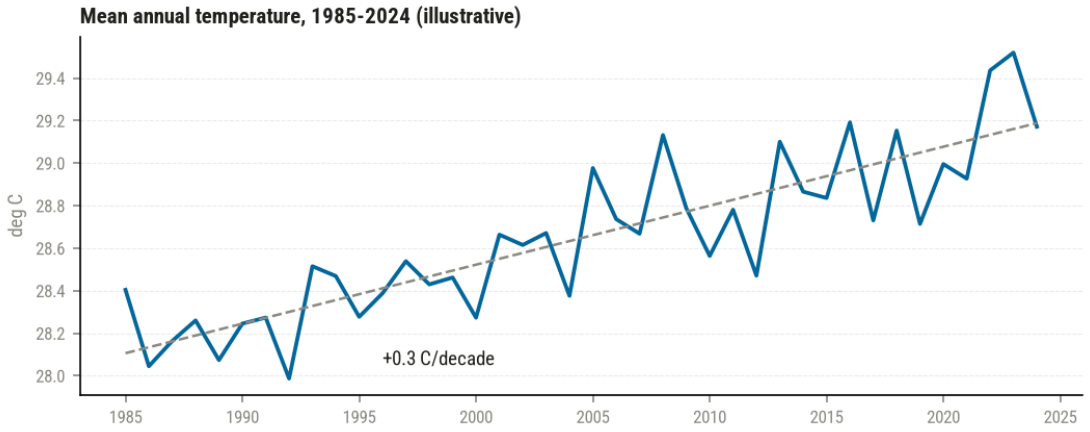

Figure 1. Mean annual temperature, 1985-2024. Dashed line: linear trend.

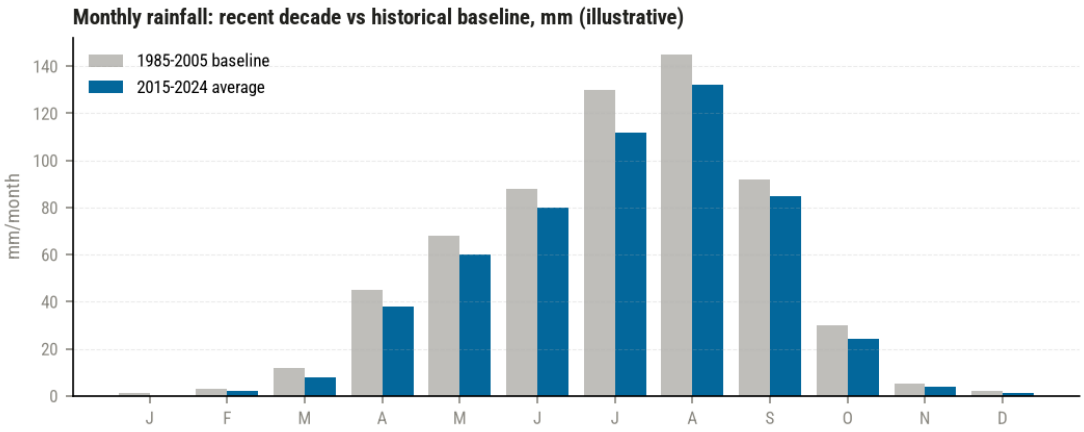

Figure 2. Monthly rainfall averages, recent decade vs 1985-2005 baseline.

## 2. Projections

Under CMIP6 medium-emission scenarios, temperatures are projected to rise a further 1.8-2.6 °C by 2060, with heavy-rainfall event intensity increasing while total annual rainfall remains uncertain. Heat-extreme days are projected to more than double by mid-century.

## 3. Hazard exposure

- Drought: recurrent, affecting the Sahelian provinces most severely
- Heat: extreme-heat days above 40 °C increasingly frequent
- Floods: flash flooding in urban areas during peak rainy season

## 4. Sector impacts

Rain-fed agriculture, which engages the large majority of the workforce, is highly exposed to the growing rainfall variability; water resources and health (heat and vector-borne disease range) are secondary concern sectors.

## 5. National response

The updated NDC commits to conditional and unconditional mitigation and adaptation targets; the National Adaptation Plan prioritizes agriculture, water and livestock. Links to the registry submissions are cited in the annex.
